one of the great challenges in ecophysiology is linking physiological measures in wild animal populations with changes in individual fitness physiological variables that indicate nutritional state stress disease or injury are used extensively in veterinary practice and captive settings to assess the health and likelihood of reproductive success of many animals the development and refinement of sampling methods that limit disturbance of animals coupled with advancements in analytical methods have allowed researchers to begin to examine the relevance of these physiological parameters in wild animals for predicting population trends and response to environmental perturbations however despite extensive research in this field consistent correlations between fitness and or population health and physiological measures remain rare
